

VIASAT MOBILE DYNAMIC DEFENSE

Security that goes deeper, so missions can go further

Managing the Device Isn't Defending the Mission

Mobile devices face escalating cyber threats — especially in high-stakes, sensitive environments. Viasat's Mobile Dynamic Defense (MDD) goes beyond basic device management, delivering real-time protection that goes deeper than policy — so missions can go further.

Security That Goes Deeper

Unlike traditional MDMs that rely on constant connectivity, MDD embeds security directly on the device. The MDD Client continuously monitors device integrity, user behavior, and network activity, enforcing policy and responding to threats in real time — even when disconnected.

Missions That Go Further

By removing reliance on centralized management, MDD enables secure mobile operations in disconnected, intermittent, and low bandwidth (DIL) environments. Policies can be updated remotely, over USB, or via QR code—allowing rapid adaptation as missions change.

Engineered for the Devices You Rely On

MDD is fully compatible with the Samsung devices your missions depend on. From commercial to Tactical Edition, MDD helps ensure every device stays secured.

Key Features

- › **On Device Security Enforcement**
Policies enforced locally, with or without connectivity
- › **Automated Threat Response**
Instantly quarantine, reboot, restrict or erase without human interaction
- › **Disconnected Operations**
Full protection in DIL environments
- › **Instant QR-based Management**
Enroll devices, change policies & more by scanning a QR code
- › **Seamless Application Management**
Remotely add, remove, and synchronize apps and data
- › **Assured Device Integrity**
Device integrity is continuously cryptographically verified both on-device and remotely
- › **Flexible Deployment**
Deploy from central enterprise, distributed edge, or directly on-device
- › **Integrated Hardware Device Management (HDM)**
Control cyber attack surfaces at the hardware level including the USB port and wireless radios.
